Installation Manual
Multi Port Flow Selector Unit
RBM-Y1801F4PE
RBM-Y1801F6PE
Multi Port Flow Selector Unit (hereafter "Flow Selector unit")

Thank you very much for purchasing TOSHIBA Super Heat Recovery Multi (SHRM) Air conditioner. Please read this manual carefully before using your Flow Selector unit.

- When installing an indoor or outdoor unit, follow the installation manual supplied with the unit.
- To connect the Flow Selector unit to an outdoor unit with pipes, a branching joint or header is required. Choose one according to the capacity of the units.

ADOPTION OF NEW REFRIGERANT

This Super Heat Recovery Multi Air Conditioner is a new type which adopts a new refrigerant HFC (R410A) instead of the conventional refrigerant R22 in order to prevent destruction of the ozone layer. Be sure to use an indoor or outdoor unit in combination with the new refrigerant.

PRECAUTIONS FOR SAFETY

• Ensure that all Local, National and International regulations are satisfied.
• Read this “PRECAUTIONS FOR SAFETY” carefully before Installation.
• The precautions described below include the important items regarding safety. Observe them without fail.
• After the installation work, perform a trial operation to check for any problem.
Follow the Owner’s Manual to explain how to use and maintain the unit to the customer.
• Turn off the main power supply switch (or breaker) before the unit maintenance.
• Ask the customer to keep the Installation Manual and explain the customer in detail of this installation completion state.

WARNING

• Ask an authorized dealer or qualified installation professional to install/maintain the air conditioner. Inappropriate installation may result in water leakage, electric shock or fire.
• Turn off the main power supply switch or breaker before attempting any electrical work. Make sure all power switches are off. Failure to do so may cause electric shock.
• Connect the connecting wire correctly. If the connecting wire is connected in a wrong way, electric parts may be damaged.
• When moving the air conditioner for the installation into another place, be very careful not to enter any gaseous matter other than the specified refrigerant into the refrigeration cycle. If air or any other gas is mixed in the refrigerant, the gas pressure in the refrigeration cycle becomes abnormally high and it as a result causes pipe burst and injuries on persons.
• Do not modify this unit by removing any of the safety guards or by by-passing any of the safety interlock switches.
• Exposure of unit to water or other moisture before installation may cause a short-circuit of electrical parts. Do not store it in a wet basement or expose to rain or water.
• After unpacking the unit, examine it carefully if there is possible damage.
• Do not install in a place that might increase the vibration of the unit.
• To avoid personal injury (with sharp edges), be careful when handling parts.
• Perform installation work properly according to the Installation Manual. Inappropriate installation may result in water leakage, electric shock or fire.
• When the air conditioner is installed in a small room, provide appropriate measures to ensure that the concentration of refrigerant leakage occur in the room does not exceed the critical level.
• Install the air conditioner securely in a location where the base can sustain the weight adequately.
• Perform the specified installation work to guard against an earthquake. If the air conditioner is not installed appropriately, accidents may occur due to the falling unit.
• If refrigerant gas has leaked during the installation work, ventilate the room immediately. If the leaked refrigerant gas comes in contact with fire, noxious gas may generate.
• After the installation work, confirm that refrigerant gas does not leak. If refrigerant gas leaks into the room and flows near a fire source, such as a cooking range, noxious gas might generate.
• Electrical work must be performed by a qualified electrician in accordance with the Installation Manual. Make sure the air conditioner uses an exclusive power supply. An insufficient power supply capacity or inappropriate installation may cause fire.
• Use the specified wires for wiring connect the terminals securely fix.
To prevent external forces applied to the terminals from affecting the terminals.
• Conform to the regulations of the local electric company when wiring the power supply. Inappropriate grounding may cause electric shock.
• Do not install the air conditioner in a location subject to a risk of exposure to a combustible gas. If a combustible gas leaks, and stays around the unit, a fire may occur.

CAUTION

New Refrigerant Air Conditioner Installation

• THIS AIR CONDITIONER ADOPTS THE NEW HFC REFRIGERANT (R410A) WHICH DOES NOT DESTROY OZONE LAYER.
The characteristics of R410A refrigerant are; easy to absorb water, oxidizing membrane or oil, and its pressure is approx. 1.6 times higher than that of refrigerant R22. Accompanied with the new refrigerant, refrigerating oil has also been changed. Therefore, during installation work, be sure that water, dust, former refrigerant, or refrigerating oil does not enter the refrigerating cycle.
To prevent charging an incorrect refrigerant and refrigerating oil, the sizes of connecting sections of charging port of the main unit and installation tools are changed from those for the conventional refrigerant.
Accordingly the exclusive tools are required for the new refrigerant (R410A).
For connecting pipes, use new and clean piping designed for R410A, and please care so that water or dust does not enter. Moreover, do not use the existing piping because there are problems with pressure-resistance force and impurity in it.
2 INSTALLATION OF NEW REFRIGERANT AIR CONDITIONER

This air conditioner adopts the new HFC refrigerant (R410A) which does not deplete the ozone layer.

- R410A refrigerant is apt to be affected by impurity such as water, oxidizing membrane, or oils because the pressure of R410A refrigerant is higher than that of the former refrigerant by approx. 1.6 times. 
- Accompanied with adoption of the new refrigerant, refrigerating oil has been also changed. 
- Therefore pay attention so that water, dust, former refrigerant, or refrigerating oil does not enter into the refrigerating cycle of the new refrigerant air conditioner during installation work.

Required tools and cautions on handling

It is necessary to prepare the tools and parts as described below for the installation work. 

The tools and parts which will be newly prepared in the following items should be restricted to the exclusive use.

Explanation of symbols

- : Newly prepared (It is necessary to use it properly exclusive to R410A separated from those for R22 or R407C.)
- o : Former tool is available.

</table>

Refrigerant piping

- Piping material used for the conventional refrigerant cannot be used.
- Use copper pipe with 0.8mm or more thickness for Ø6.4, Ø9.5, Ø12.7mm.
- Use copper pipe with 1.0mm or more thickness for Ø15.9mm, Ø19.1mm, Ø22.2mm or more.
- Use clean and new pipes for the refrigerant pipes and perform piping work so that water or dust does not contaminate the refrigerant.

3 SELECTION OF INSTALLATION PLACE

CAUTION

Do not install the air conditioner at place where combustible gas may leak. If gas leaks and is collected at surrounding the unit, the production of fire may be caused.

Cautions for Installation at a Place with the Quiet Background Sound

As the Flow Selector unit incorporates the solenoid valve, the refrigerant sound or the operating sound of the solenoid valve such as “Bushuu...” generates when exchanging between cooling and heating mode and during defrost operation. Therefore, avoid installing the unit at a place with quiet background sound as follows.

(1) Rooms which have no ceiling and a fabric does not block the residence space from the Flow Selector unit.
(2) Rooms which have opening port at the ceiling.

When installing the unit at the above places, separate the unit from the indoor unit (more than 10 m) and install the unit at a place so that sound does not transmit into the room such as in the corridor ceiling.

Upon customer’s approval, install the air conditioner at a place where satisfies the following conditions.

- Place where it can be installed horizontally.
- Place which can reserve a service space for safe maintenance or check.
- Place where there is no problem even if the drained water flows.

Apply electric insulation between metal section of the building and metal section of the air conditioner in conformance with the Local Regulation.

Avoid the following places.

- Salty place (seaside area) or place with much gas sulfide (hot spring area) 
  (If selecting such a place, a special maintenance is required.)
- Place where oil (including machine oil), steam, oil smoke or corrosive gas generates.
- Place where a device generating high frequency (inverter, non-utility generator, medical apparatus, or communication equipment) is set. (A bad influence may generate by malfunction of the air conditioner, control trouble, or noise for such equipment.)
**Installation under high-humidity atmosphere**

In some cases including the rainy season, especially inside of the ceiling may become high-humidity atmosphere (dew-point temperature: 23 °C or higher).

1. Installation to inside of the ceiling with tiles on the roof
2. Installation to inside of the ceiling with slated roof
3. Installation to a place where inside of the ceiling is used for pathway to intake the fresh air
4. Installation to a kitchen

   - In the above cases, additionally attach the heat insulator to all positions of the air conditioner, which come to contact with the high-humidity atmosphere. In this case, arrange the side plate (Check port) so that it is easily removed.

</tr>
<tr>
<td>24 °C wet bulb temperature</td>
</tr>
<tr>
<td>Air volume: Low air volume, operation time 4 hours</td>
</tr>
</tbody>
</table>

**Installation and service space**

Reserve sufficient space required for installation or service work.

- Make space for installation and service. (Make space to the electrical parts box cover side for service.)
- When installing the unit inside the ceiling, be sure to create a check port. The check port is required when the unit is installed and serviced.
- Keep a clearance of 150mm or more between the top panel of the unit and the ceiling.
- The length of a connection pipe to the indoor unit should be 50m or less.

<Installation space>

![Diagram of installation space]

**Installation of hanging bolt**

- Consider the piping / wiring before the unit is hung to determine the location of the Flow Selector unit installation and orientation.
- After the location of the Flow Selector unit installation has been determined, install hanging bolts.
- For the dimensions of the hanging bolt pitches, refer to the external view.
- When a ceiling already exists, lay the drain pipe, refrigerant pipe, control wires, and remote controller wires to their connection locations before hanging the Flow Selector unit.

Procure hanging bolts washer and nuts for installing the Flow Selector unit (these are not supplied).

<table>

Installation of Flow Selector unit

Treatment of ceiling
The ceiling differs according to structure of building.
For details, consult your constructor or interior finish contractor.
In the process after the ceiling board has been removed, it is important to reinforce ceiling foundation (frame) and to keep horizontal level of installed ceiling correctly in order to prevent vibration of ceiling board.

- Attach the nuts and the M10 flat washers to the hanging bolt.
- Put washers at up and down of the hanging bracket of the Flow Selector unit to hang down the Flow Selector unit.
- Check that four sides are horizontal with a level gauge. (Horizontal degree: Within 5 mm)
5 DRAIN PIPING

CAUTION

Following the Installation Manual, perform the drain piping work so that water is properly drained. Apply a heat insulation so as not to cause a dew condensation. Inappropriate piping work may result in water leakage in the room and wet furniture.

- Provide the Flow Selector drain piping with proper heat insulation.
- Provide the area where the pipe connects to the unit with proper heat insulation. Improper heat insulation will cause condensation to form.
- The drain pipe must be sloping downward (at an angle of 1/100 or more), and do not run the pipe up and down (arched shape) or allow it to form traps. Doing so may cause abnormal sounds.
- Restrict the length of the traversing drain pipe to 20 meters or less. For a long pipe, provide support brackets at intervals of 1.5 to 2 meters to prevent waving.
- Install the collective piping as shown in the following figure.
- Do not provide any air vents. Otherwise, the drain water will spout, causing water to leak.
- Do not allow any force to be applied to the connection area with the drain pipe.
- A hard PVC pipe cannot be connected to the drain pipe connecting port of the Flow Selector unit. Be absolutely sure to use the flexible hose provided for the connections with the drain pipe connecting port.
- Adhesive agents cannot be used for the drain pipe connecting port (hard socket) of the Flow Selector unit. Be absolutely sure to use the flexible hose provided. Use of an adhesive agent may damage the drain pipe connecting port or cause water to leak.
- When down-gradient cannot be secured for the drain pipe, drain-up kit (locally procured) is possible.

---

Connection of drain hose

- Insert the attached drain hose into the drain pipe connecting port on the drain pan up to the end.
- Fit the attached hose band to the end of the pipe connecting port, and then tighten it securely.

REQUIREMENT

- Fix the drain hose with the attached hose band, and set the tightening position upward.
- As the draining is the natural water draining, arrange the pipe outside of the unit on the down slope.
- If piping is performed as shown in the figure, drain cannot be discharged.

Pipe material, size and insulator

The following materials for piping work and insulating process are procured locally.

<table>
<thead>
<tr>
<th>Pipe material</th>
<th>Insulator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hard vinyl chloride pipe VP20 (Nominal outer diameter 026 mm)</td>
<td>Foamed polyethylene foam, thickness: 10 mm or more</td>
</tr>
</tbody>
</table>

---

Connect the hard vinyl chloride pipe (locally procured) to the mounted drain hose which was attached. When Plug is detached, the drain pipe is not damaged. It causes the water leak.

In case of taking pipe from the left side

In case of taking pipe from the left side, exchange the plug from left to right. Push in the plug of which end is not sharp up to the end.
Heat insulating process

- Using the attached drain hose heat insulator, lap the connecting section and the drain hose without clearance, and then tighten with two handing band so that heat insulator does not open.
- Covering the attached drain hose heat insulator, lap the heat insulator (locally procured) to the drain pipe without clearance.

Check the draining

After installation work, check that water drain is properly performed and water does not leak from the connect the pipes.

Check port

Plastic container (to pour water)

Capacity

Permissible pipe length and permissible height difference

The length of a connection pipe to the indoor unit should be 50m or less. For details, refer to the installation manual attached to the outdoor unit.

* Connectable indoor units of 1 port: 18.0 kW or less and 10 units or less.

## Pipe connecting process

- **Connect the pipes.**
- **Use stopper-pipe (accessory) to the port to which indoor unit is not connected.**
- **Use attached-pipe (accessory) to connect the pipe with different diameter from the pipe to Flow Selector unit.**

### CAUTION

- Be sure to wrap the pipe with wet cloth when applying brazing.

- For a brazing work of the refrigerant pipes, be sure to use nitrogen gas in order to prevent oxidation of the inside of the pipes; otherwise clogging of the refrigerating cycle due to oxidized scale may occur.
- *Remove all flux after brazing.*
Airtight test/Air purge, etc.

For airtight test, air purge, addition of refrigerant, and gas leak check, follow the Installation Manual attached to the outdoor unit.

REQUIREMENT

Be sure to use the tool such as charge hose exclusive to R410A. Do not turn on the power until the airtight test and the vacuuming have finished. (If turning on the power, the incorporated PMV is closed fully and the period until the vacuuming finishes elongates.)

Open fully valves of the outdoor unit

Gas leak check

Check with a leak detector or soap water whether gas leaks or not, from the pipe connecting section.

REQUIREMENT

Use a leak detector manufactured exclusively for HFC refrigerant (R410A, R134a, etc.).

Heat insulating process

Perform heat insulating for each pipes separately. In cooling time, temperature at both liquid and gas sides becomes lower. Therefore, perform heat insulating process sufficiently to avoid dewing.

- For heat insulator of pipe at gas side, be sure to use one with heat-resistant temp. 120°C or more.
- Using the attached heat insulating pipe, perform heat insulating process securely for pipe connecting part of the Flow Selector units without clearance.

Power supply wire and communication wires specifications

Power supply wire and communication wires are locally procured. For the power supply specifications, follow to the table below. If capacity is little, it is dangerous because overheat or burnout may be caused.

<table>
<thead>
<tr>
<th>Power supply</th>
<th>220-240 V ~, 50 Hz</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power supply switch / circuit breaker or power supply wiring / fuse rating for Flow Selector units should be selected by the accumulated total current values of the Flow Selector units.</td>
<td></td>
</tr>
</tbody>
</table>

Communication wiring

- 2-core with non-polarity wire is used for wiring of the communication wiring.
  - Wire size : 0.5 mm² to 2.0 mm²
  - Up to 200 m total length of wiring between indoor units and Flow selector unit. (L2 + L3)
  - Up to 300 m (L1 + L2 + L3)
  - Up to 300 m (L1)
**Wire connection**

**REQUIREMENT**

- Connect the wires matching the terminal numbers. Incorrect connection causes a trouble.
- Pass the wires through the bushing of wire connection holes of the Flow Selector unit.
- Keep a margin (Approx. 100 mm) on a wire to hang down the electrical control box at servicing.
- The low-voltage circuit is provided for the communication wires. (Do not connect the high-voltage circuit)

1. Loosen the cover mounting screws (4 positions) of the electrical control box, and then remove the cover.
2. The cable clamp (accessory) is installed in the underside of the Flow Selector unit.
3. Connect the power supply wire and communication wires to the terminal blocks of the electrical control box.
4. Tighten screws of the terminal block securely, and fix the wires with cord clamp attached to the electrical control box. (Do not apply tension to the connecting section of the terminal block.)
5. Mount the cover of the electrical control box so that it does not pinch the wires.

**Connecting power supply wire and communication wires**

- Clamp all cables
- Clamp the communication wire
- Attach round shaped terminal (locally procured)
- Turn
- 50 to 60 mm
- Clamp filter (Accessory)
- Binding band (Accessory)
- Hook 2 nails
- Communication wire (locally procured)
- Earth screw
- Cable clamp (Accessory)
- Power supply terminal block

*The maximum connection number of remote controller per group is 2 pcs.*

**CAUTION**

The communication wiring and AC 220-240 V wires cannot be parallel to contact each other and cannot be stored in the same conduits. If doing so, a trouble may be caused on the control system due to noise or other factor.
See the figure on the left for connecting wires to the terminal.

**Communication wiring**

Terminal block for remote controller wiring of indoor unit

![Diagram of terminal block with labels: A, B, F3 unit terminal on PCB, Communication wires (locally procured)]

It's possible to come out the communication wires on the right side.

![Diagram of FS unit with labels: Cable clamp (Accessory), Clamp all cables, Communication wire]

Setting when connecting indoor units to FS (Flow Selector) unit

Cautions to connection of indoor unit

- When connecting the indoor units to a branch of FS unit, it is necessary to set up the CODE No. Be sure to set up the CODE No. after setup of address.
- When connecting the indoor units to a branch of FS unit, it is possible to connect with multiple groups and connect individually.

How to set up CODE No. [0E]

It is necessary to set up in case of the group control.

1. Push and hold the \( \text{\textbullet} \), \( \text{\textbullet} \), and \( \text{\textbullet} \) buttons at the same time for more than 4 seconds.
   - All is displayed in the UNIT No. window.
   - In this time, the fans of all the indoor units in the group control start the fan operation.
2. Using the set temperature buttons \( \text{\textbullet} \) / \( \text{\textbullet} \), select the CODE No. “0E”.
3. Change SET DATA to “0” “0” by the timer buttons \( \text{\textbullet} \) / \( \text{\textbullet} \).
4. Push \( \text{\textbullet} \) button.
5. Push \( \text{\textbullet} \) button. Then the setup finished.

How to set up CODE No. [FE]

In cases other than connecting with one indoor unit or one group in one branching, it is necessary to set up.
- Set up CODE No. “FE” in one branching within the range of 1～64. This CODE No. should not be duplicate in one system.

How to set up CODE No. [FD]

In cases other than connecting with one indoor unit or one group in one branching, it is necessary to set up.
- 0 : Heating prioritized (Factory default)
- 1 : Cooling prioritized

Caution to connection of indoor unit

When connecting the indoor units to FS unit, it is necessary to set up the CODE No..
- When connecting the indoor units to FS unit, group control and individual control are available.
  - [0E] : Group setting
    - 0 : Individual (Factory default)
    - 1 : Group
  - [FE] : Branching system address (1～64)
    - Should not be duplicate in one system
    - Factory default : 99
  - [FD] : Priority operation mode
    - 0 : Heating prioritized (Factory default)
    - 1 : Cooling prioritized (The cooling is prioritized even if setting only one unit in one branching)

Set up example

Case that FE/FD setting is not necessary

Case that FE/FD setting is necessary

In case of connecting one indoor unit

In case of connecting one group operation of indoor units
In case of connecting two group operations of indoor units:

- Indoor unit
- FS unit
- Remote controller

- Incorrect connection examples:

  ![Incorrect connection examples diagram]

- In case of connecting one group operation of indoor units and two indoor units:

  ![Diagram showing connection setup]

- Incorrect connection examples:

  ![Incorrect connection examples diagram]

- In case of connecting four indoor units:

  ![Diagram showing connection setup]

  ![Incorrect connection examples diagram]

- In case of connecting Drain pump (locally procured):

  It's available to connect the operation-off signal input cable of float switch. At that time, the cable is taken from the hole on the control-box bottom side and connect to CN34 on PC board of unit No.1 (showing “1” on the label).

  Be sure to connect the energized indoor unit to unit No.1 of FS unit.

  Attach Rubber-bushing (accessory) to the hole to prevent the cable is damaged by edge of hole. The length of a float switch cable should be 5 m or less.

  Attach Clamp-filter (accessory) Connect to CN34

  To turn at once in the filter

  Binding band (accessory)

  Control box

  Float switch cable (locally procured)

  Attach Rubber-bushing (accessory)

  Cut away

  In case of connecting float switch, concatenate between each CN34 of all P.C.board with wires (locally procured).
